

QA Testing — Lessons Learned

Version: 1.0.0 | Updated: 2026-04-30 Mac Air OBE Clean Install — March 17, 2026 Tester: Manuel Barbero | Platform: MacBook Air M4, 16GB, macOS Sequoia 15.6

Executive Summary

The OBE clean install on a fresh Mac Air exposed critical gaps that would have blocked or confused any first-time user. Most issues were invisible during development because the developer machine already had all dependencies installed. The most severe issues were PDF line-wrapping breaking shell commands, Python version detection, and the start.sh demo path bug.

Severity breakdown: - 🛑 Showstoppers (would block install): 3 - 🟡 Significant friction (confusing, recoverable): 8 - 🟢 Polish (UX improvements): 7

Root cause categories: - [ENV] Environment assumption — dev machine had something pre-installed - [DOC] Documentation gap — step unclear or missing - [BUG] Code/config bug — actual defect in the product - [UX] User experience — confusing but not broken - [PDF] PDF rendering artifact — commands broken by line-wrapping

🛑 Showstopper Issues

1. Python Version Detection Failure

What happened: Step 7 used `python3` which resolved to the system Python 3.9 (from Xcode Command Line Tools) instead of the user-installed Python 3.14. This built a broken `.venv` that failed with:

```
TypeError: Unable to evaluate type annotation 'float | None'
```

Root cause category: [ENV] + [DOC] Dev machine had Python 3.13 as the default `python3`. Fresh Mac doesn't. QUICKSTART never warned that macOS system `python3` is 3.9.

Fix applied: Step 7 now uses auto-detect chain trying 3.14 → 3.13 → ... → 3.10.

QUICKSTART: Step 7 updated. **README:** Minimum Python changed to 3.10+. **TODO:** Add a preflight check script (`scripts/check_env.sh`) that validates Python version, PATH, and required tools before the user starts.

2. PDF Line-Wrapping Breaks Shell Commands

What happened: The Qdrant install command in Step 5 was split across lines in the PDF. Copy-pasting wrote a broken line to `~/.zshrc`, corrupting PATH for every subsequent Terminal session. Basic commands (`mkdir`, `ollama`, `echo`) stopped working. **Root cause category:** [PDF] + [DOC] Multi-line commands are inherently fragile in PDF format. No warning was given.

Fix applied: Step 5 now uses a single `&&`-chained command that PDF cannot break. Warning added at top of QUICKSTART directing users to GitHub for copy-paste. **TODO:** All commands in QUICKSTART must be single-line or verified PDF-safe. Add automated check to CI that validates no command in QUICKSTART spans more than one line (future).

3. start.sh Demo Corpus Path Bug

What happened: `start.sh` referenced `data/demo/demo_data` — the old path before corpus restructure. Auto-ingest failed on first run. **Root cause category:** [BUG] Corpus restructure commit updated the ingest command but missed `start.sh`.

Fix applied: Patched in fbfebf8, validated via `git pull` on Mac Air. **TODO:** When moving files, add a repo-wide grep for old paths as part of the commit checklist. Consider adding a test that validates `start.sh` paths exist in the repo.

Significant Friction Issues

4. `llama3.1:8b` Not Marked as Required

What happened: Listed alongside optional models. Tester skipped it. Every query returned 500 error: `model 'llama3.1:8b' not found`. **Root cause category:** [DOC] **Fix applied:** Step 4 now clearly separates required vs optional. **TODO:** `start.sh` should check that `llama3.1:8b` is available before starting and print a clear error if not.

5. Ollama `ollama list` Timing Issue

What happened: `ollama list` immediately after `brew services start` returned `could not connect to ollama server`. **Root cause category:** [DOC] Ollama needs ~3 seconds to initialize after brew starts it. **Fix applied:** Added "wait 5 seconds, then verify" to Step 3. **TODO:** `start.sh` already handles this with a wait loop — document the pattern.

6. Skip Logic Not Explained

What happened: "Skip if already installed" confused tester — didn't know what a successful install looks like. **Root cause category:** [DOC] **Fix applied:** Every step now has explicit "if you see X — skip to next step" language. **TODO:** Consider a preflight script that checks and reports which steps can be skipped.

7. # Comment Lines in Commands Cause Errors

What happened: Multiple `zsh: command not found: #` errors from copy-pasting blocks that included comment lines. **Root cause category:** [DOC] + [UX] Despite warnings, this kept happening because the PDF presented commands and comments as a single visual block. **Fix applied:** All `#` comments removed from all commands in QUICKSTART. **TODO:** Zero tolerance policy — enforce in doc review. Consider a linter.

8. Two Pythons Coexisting Silently

What happened: `python3 --version` returned 3.9.6 on the same machine where `python3.14 --version` returned 3.14.0. No warning in QUICKSTART. **Root cause category:** [ENV] + [DOC] **Fix applied:** Note added explaining macOS Python version coexistence. **TODO:** preflight check script would catch this automatically.

9. First Query 30-40 Second Wait With No Feedback

What happened: First query appeared to hang — no UI feedback during model cold load. **Root cause category:** [UX] **Fix applied:** QUICKSTART now warns: "First query may take 30-40 seconds." **TODO:** Add a loading indicator or progress message in the UI for first-query cold load. Current amber→green status pill doesn't communicate this.

10. Absolute Path Required After PATH Corruption

What happened: After `~/.zshrc` corruption, `ollama` stopped working entirely. Required `/opt/homebrew/bin/ollama` as workaround. **Root cause category:** [PDF] (downstream of issue #2) **Fix applied:** Documented in Troubleshooting section A. **TODO:** Add `~/.zshrc` health check to preflight script.

11. Port 8000 Already in Use on start.sh Re-run

What happened: Second `start.sh` run (after `git pull`) tried to start a second uvicorn on port 8000. Got `[Errno 48] address already in use`. Auto-ingest still completed despite the error — confusing output. **Root cause category:** [BUG] **Fix applied:** None yet — documented in troubleshooting. **TODO:** `start.sh` should check if port 8000 is occupied before starting uvicorn, and either kill the old process or skip starting a new one.

Polish / UX Issues

12. Terminal Not Explained for Non-Technical Users

Root cause category: [DOC] — assumed knowledge. **Fix applied:** Step-by-step Terminal instructions, ⌘ Space shortcut explained, Dock tip added.

13. Progress Bar Interleaved with Qdrant Log Messages

Root cause category: [UX] — Qdrant and ingest run in parallel, logs mix. **TODO:** `--quiet` flag for `start.sh` (v2.0).

14. Brew Version Said 4.x, Got 5.x

Root cause category: [DOC] — stale version number. **Fix applied:** "5.x.x or newer (current as of 2026)."

15. No Terminal Shortcut / Dock Tip

Root cause category: [DOC]. **Fix applied:** Added Dock tip and ⌘ Space instruction.

16. PDF vs GitHub Version Gap

Root cause category: [PDF]. **Fix applied:** Warning at top of QUICKSTART. **TODO:** Ship QUICKSTART.pdf with repo but watermark: "For commands, use GitHub."

17. HF Hub Authentication Warning

Root cause category: [UX] — alarming but harmless. **Fix applied:** Documented in Step 8 expected output.

18. UNEXPECTED CrossEncoder Key Warning

Root cause category: [UX] — alarming but harmless. **Fix applied:** Documented in Step 8 expected output.

What the Developer Machine Masked

The following issues were invisible during development:

Issue	Why Masked
System Python 3.9 vs user Python 3.14	Dev machine had 3.13 as default <code>python3</code>
Fresh <code>~/ .zshrc</code>	Dev's was already correctly configured
<code>llama3.1:8b</code> not downloaded	Already on dev machine
start.sh path bug	Demo already ingested on dev machine
First-query 40s cold load	Model always warm on dev machine
Qdrant binary PATH issue	Dev's <code>~/bin</code> already in PATH
PDF line-wrapping	Dev never copy-pastes from PDF

Key lesson: The developer environment is a terrible proxy for a fresh install. OBE on a truly clean machine should be run after every significant release.

Recommended Demo Questions (Mac Air Validated)

Questions that produced strong answers on both llama3.1:8b and mistral:7b:

1. "Explain the concept of plateau and its use in the context of planning"
2. "Why should you not spend too much time on intermediary plateaus?"
3. "How should a CTO prioritize a three-year technology strategy?"
4. "What are the key principles for modernizing legacy applications?"

Notes on these questions: - Question 1 is best overall — grounded in the 2006 FS Journal article - Question 2 is a great follow-up to question 1 - Question 3 produces a strong multi-source answer - Question 4 takes ~22s but good results on both models

Avoid as demo questions: - Questions about CMDB — retrieves IT Infrastructure doc first, less relevant - Open-ended AI limitation questions — may not have strong demo corpus grounding

Validation Results

Check	Result	Notes
Clean install from zero	✅ Success	With workarounds for 3 showstoppers
Demo corpus auto-ingest	✅ After git pull fix	fbfebf8
llama3.1:8b query	✅ 22s first query	Cold load
mistral:7b query	✅ 18s, strong answer	Often better than 8b
Page numbers in citations	✅ Correct	p.20, p.16, p.5 etc.
Open ↗ links	✅ Opens correct document	Page scroll is v2.0
git pull → instant fix	✅ Confirmed	Key workflow validated
Python 3.14 compatibility	✅ Confirmed	Not officially tested before

Action Items Summary

Item	Priority	Owner	Target
preflight check script (<code>scripts/check_env.sh</code>)		Dev	v1.1
start.sh: check llama3.1:8b available		Dev	v1.1
start.sh: port 8000 conflict handling		Dev	v1.1
start.sh: <code>--quiet</code> flag		Dev	v2.0
Ship QUICKSTART.pdf with GitHub watermark		Doc	Next release
Repo-wide path grep on corpus moves		Process	Ongoing
UI loading indicator for cold model load		Dev	v2.0
